

Mathematical PROCESSES

The seven interrelated **mathematical processes** are intended to permeate teaching and describe the critical aspects of learning, doing, and understanding mathematics. These processes allow students to engage in thinking about mathematics, and support the acquisition and the use of mathematical knowledge and foundational skills that develop conceptual understanding.

These processes are outlined in detail in [Kindergarten to Grade 8 Mathematics: Manitoba Curriculum Framework of Outcomes \(2013\)](#).

- [C] COMMUNICATION
- [CN] CONNECTIONS
- [ME] MENTAL MATHEMATICS AND ESTIMATION
- [PS] PROBLEM SOLVING
- [R] REASONING
- [T] TECHNOLOGY
- [V] VISUALIZATION

NUMBER Strand

- **Representation of Rational Numbers**
Relationships between decimals and fractions **N.4**
Fractions, decimals, and integers **N.7**
- **Operations with Whole Numbers**
Divisibility rules **N.1**
Addition and subtraction of integers **N.6**
- **Operations with Rational Numbers**
Problems involving the operations of decimals **N.2**
Problems involving percents **N.3**
Addition and subtraction of fractions **N.5**

PATTERNS AND RELATIONS Strand

- ▶ **Patterns**
- **Patterning and Algebraic Thinking**
Patterns and their relations **PR.1**
Problems involving tables of values and their graphs **PR.2**
- ▶ **Variables and Equations**
- **Algebraic Representations with Expressions and Equations**
Preservation of equality **PR.3**
Expressions and equations **PR.4**
Variables **PR.5**
Problems involving linear equations **PR.6 PR.7**

SHAPE AND SPACE Strand

- ▶ **Measurement**
- **Length and Angles**
Circles **SS.1**
- **Area**
Formulas **SS.2**
- ▶ **3-D Objects and 2-D Shapes**
- **Identifying, Sorting, Comparing, and Constructing**
Geometric constructions **SS.3**
- ▶ **Transformations**
- **Position and Motion**
The Cartesian plane and transformations **SS.4 SS.5**

STATISTICS AND PROBABILITY Strand

- ▶ **Data Analysis**
- **Collection, Organization, and Analysis of Data**
Central tendency and range **SP.1 SP.2**
Problems involving circle graphs **SP.3**
- ▶ **Chance and Uncertainty**
- **Probability**
Expression of probability **SP.4**
Experimental and theoretical probabilities and independent events **SP.5 SP.6**

- ▶ **Substrands**
- **Learning Targets**

Grade 7 Mathematics at a Glance can be used in designing, planning, and assessing student learning for the year. It can be used as a planning tool to preview the content of the [Grade 7 Mathematics curriculum](#).

It is organized by **strands** and sorts learning outcomes into categories or **learning targets**. The learning targets can be used to connect learning by integrating strands, learning outcomes, and other subject areas.

This document can be used with the *Glance Across the Grades* document to plan clear and concise expectations for student learning by using big ideas (the why behind what we are learning).

NUMBER Strand

• Representation of Rational Numbers

Demonstrate an understanding of the relationship between repeating decimals and fractions, and terminating decimals and fractions. ■■■► N.4

Compare and order fractions, decimals (to thousandths), and integers by using benchmarks, place value, and equivalent fractions and/or decimals. ◀■ N.7

• Operations with Whole Numbers

Determine and explain why a number is divisible by 2, 3, 4, 5, 6, 8, 9, or 10, and why a number cannot be divided by 0. ■ N.1

Demonstrate an understanding of addition and subtraction of integers. ■■■► N.6

• Operations with Rational Numbers

Demonstrate an understanding of addition, subtraction, multiplication, and division with decimals to solve problems. ■■■► N.2

Solve problems involving percents from 1% to 100%. ■■■► N.3

Demonstrate an understanding of adding and subtracting positive fractions and mixed numbers, with like and unlike denominators (limited to positive sums and differences). ■■■► N.5

PATTERNS AND RELATIONS Strand

► Patterns

• Patterning and Algebraic Thinking

Demonstrate an understanding of oral and written patterns and their corresponding relations. ◀■ PR.1

Construct and graph a table of values from a relation, and analyze the graph to draw conclusions and solve problems. ◀■ PR.2

► Variables and Equations

• Algebraic Representations with Expressions and Equations

Demonstrate an understanding of preservation of equality by modelling it and applying it to solve equations. ◀■ PR.3

Explain the difference between an expression and an equation. ■ PR.4

Evaluate an expression given the value of the variable(s). ■■■► PR.5

Model and solve problems that can be represented by linear equations in the form:

- $x + a = b$ where a and b are integers

and

- $ax + b = c$

- $ax = b$

- $\frac{x}{a} = b, a \neq 0$

where $a, b,$ and c are whole numbers. ■■■► PR.6 PR.7

SHAPE AND SPACE Strand

► Measurement

• Length and Angles

Demonstrate an understanding of circles by describing relationships among and solving problems with radii, diameters, and circumferences, by relating circumference to pi (π), by determining the sum of central angles, and by constructing circles given radius or diameter. ■■■► SS.1

• Area

Demonstrate and apply a formula for determining the area of triangles, parallelograms, and circles. ■ SS.2

► 3-D Objects and 2-D Shapes

• Identifying, Sorting, Comparing, and Constructing

Perform geometric constructions, including perpendicular and parallel line segments, and perpendicular and angle bisectors. ■ SS.3

► Transformations

• Position and Motion

Identify and plot points using integral ordered pairs, and perform and describe transformations of a 2-D shape, in the four quadrants of a Cartesian plane. ◀■ SS.4 SS.5

STATISTICS AND PROBABILITY Strand

► Data Analysis

• Collection, Organization, and Analysis of Data

Demonstrate an understanding of central tendency (mean, median, mode) and range by determining the measures of central tendency and the range, and by determining the most appropriate measure of central tendency to report findings. Determine the effect on central tendency when an outlier is included in a data set. ■ SP.1 SP.2

Construct, label, and interpret circle graphs to solve problems. ■ SP.3

► Chance and Uncertainty

• Probability

Express probabilities as ratios, fractions, and percents. ■ SP.4

Identify a sample space and conduct a probability experiment to compare the theoretical and experimental probabilities of two independent events. ■■■► SP.5 SP.6

- Concept/learning outcomes are taught in this grade only and will be applied in future grades.
- ◀■■■ Concept/learning outcomes introduced in previous grade(s) are further taught in this grade and will be applied in future grades.
- Concept/learning outcomes are taught for the first time in this grade and will be taught in future grade(s).
- ◀■ Concept/learning outcomes introduced in previous grades are taught in this grade and will continue to be taught in future grades.

REPORT CARD CATEGORIES

KNOWLEDGE AND UNDERSTANDING OF MATHEMATICAL CONCEPTS

The student demonstrates knowledge and understanding of grade-specific mathematical concepts and skills in each strand (number, patterns and relations, shape and space, statistics and probability).

MENTAL MATH AND ESTIMATION

The student uses math knowledge and number facts to calculate mentally or estimate within each strand (number, patterns and relations, shape and space, statistics and probability). Students apply mental math strategies with efficiency, accuracy, and flexibility. They are able to make reasonable estimates of values or quantities using benchmarks and referents.

PROBLEM SOLVING

The student applies knowledge, skill, or understanding to solve problems in each strand (number, patterns and relations, shape and space, statistics and probability). By learning to solve problems and by learning through problem solving, students connect mathematical ideas in new contexts. Students think logically, visualize, model, reason, and communicate and justify their solutions.

The seven interrelated **mathematical processes** are intended to permeate teaching and describe the critical aspects of learning, doing, and understanding mathematics. These processes allow students to engage in thinking about mathematics, and support the acquisition and the use of mathematical knowledge and foundational skills that develop conceptual understanding.

These processes are outlined in detail in [Kindergarten to Grade 8 Mathematics: Manitoba Curriculum Framework of Outcomes \(2013\)](#).

 COMMUNICATION (C)	 CONNECTIONS (CN)	 MENTAL MATH AND ESTIMATION (ME)	 PROBLEM SOLVING (PS)	 REASONING (R)	 TECHNOLOGY (T)	 VISUALIZATION (V)
<p>Reading about, representing, viewing, writing about, listening to, and discussing mathematical ideas allows students to create links among their own language and ideas, the language and ideas of others, and the formal language and symbols of mathematics. Communication enables students to reflect upon, to validate, and to clarify their thinking. Expression of mathematical meaning and ideas can be accomplished orally or in written representations such as journals and learning logs.</p>	<p>Mathematics becomes more meaningful when it is contextualized and linked to students' experiences across disciplines. Furthermore, mathematics should be viewed as an integrated whole, rather than as the study of separate strands or units. Within a particular topic, students should see the connections between concrete, pictorial, and symbolic modes of representation. When mathematical ideas are connected to each other or to real-world phenomena, students begin to view mathematics as useful, relevant, and integrated.</p>	<p>Mental mathematics is a combination of strategies that enhances flexible thinking and number sense. Estimation is a strategy for determining approximate values or quantities, usually by referring to benchmarks or using referents, or for determining the reasonableness of calculated values. Estimation is often used to make mathematical judgments and to develop useful, efficient strategies for dealing with situations in daily life. Strategies in mental mathematics and estimation enable students to calculate mentally without the use of external aids. In the process, they improve their computational fluency—developing efficiency, accuracy, and flexibility.</p>	<p>Students develop understanding of mathematical concepts and procedures when they apply their mathematical knowledge to solve problems in new ways and meaningful contexts. When students encounter new situations and respond to questions of the type <i>How would you . . . ?</i> or <i>How could you . . . ?</i>, the problem-solving approach is being modelled. Problems are often open-ended, so students may arrive at multiple solutions in different and creative ways. Rich problems allow students in the class to demonstrate their knowledge, skill, or understanding at a level appropriate to them. Learning through problem solving should be the focus of mathematics at all grade levels and should be embedded throughout all topics.</p>	<p>Mathematical reasoning involves generalizing from patterns, conjecturing, validating, and proving. Students need to develop confidence in their abilities to reason and to justify their mathematical thinking. Good reasoning is as important as finding correct answers. The thinking skills developed by a focus on reasoning can be used in life in a wide variety of contexts and disciplines.</p>	<p>Technology contributes to and supports the learning of a wide range of mathematical concepts and can increase the focus on conceptual understanding by decreasing the time spent on repetitive procedures. It enables students to explore and create patterns, organize and display data, examine relationships, model situations, generate and test conjectures, solve problems, and reinforce the learning of basic facts. Technology can help to satisfy the curiosity of students and lead to rich mathematical discoveries at all grade levels. The use of technology can enhance, although it should not replace, conceptual understanding, procedural thinking, and problem solving.</p>	<p>Visual images and visual reasoning are important to a sense of number, space, and measurement. Visualization is fostered through the use of concrete materials, technology, and a variety of visual representations. Visualization can help students gain a concrete understanding of abstract concepts.</p>
