The Senior Years Student and the Science Learning Environment

Each year, teachers are called upon to make a myriad of decisions regarding course content, learning materials and resources, and instructional and assessment methods. Successful learning is more likely to occur if these decisions are informed by teachers’ understanding of their students and the ways they learn.

Teachers seeking to learn about their students need to be knowledgeable in various areas, including the following:

• **How people learn:** In recent decades, cognitive psychology, brain-imaging technology, and multiple intelligences theory have transformed our understanding of learning. Ongoing professional development is important to teachers as they seek to update their knowledge of the processes of learning.

• **The ways in which student populations are changing:** The students whom teachers encounter today are different in many respects from students a generation ago. Students are more likely to be living with a single parent or stepfamily. More have part-time jobs. Students are more sophisticated in their knowledge and use of information technology, and much of their understanding of the world comes from television. Classrooms are more likely to be ethnically diverse.

• **The developmental characteristics of Senior 3 students:** The characteristics of adolescent learners have many implications for teachers.

• **The unique qualities of each student:** Family relationships, academic and life experiences, personality, interests, learning approaches, socio-economic status, and rate of development all influence a student’s ability to learn. Teachers can gain an understanding of the unique qualities of each student only through daily interaction, observation, and assessment.

Characteristics of Senior 3 Learners

For many students, Senior 3 is a stable and productive year. Many Senior 3 students have developed a degree of security within their peer group and a sense of belonging in school. They show increasing maturity in dealing with the freedoms and responsibilities of late adolescence: romantic relationships, part-time jobs, a driver’s licence. In Senior 3, most students have a great deal of energy and a growing capacity for abstract and critical thinking. Many are prepared to express themselves with confidence and to take creative and intellectual risks. The stresses and preoccupations of preparing for graduation, post-secondary education, or full-time jobs are still a year away. For many students, Senior 3 may be the most profitable academic year of the Senior Years.
Although many Senior 3 students handle their new responsibilities and the demands on their time with ease, others experience difficulty. External interests may seem more important than school. Because of their increased autonomy, students who previously had problems managing their behaviour at school may now express their difficulties through poor attendance, alcohol and drug use, or other behaviours that place them at risk.

Students struggling to control their lives and circumstances may make choices that seem to teachers to be contrary to their best interests. Communication with the home and awareness of what their students are experiencing outside school continue to be important for Senior 3 teachers. Although the developmental variance evident in Grade 6 through Senior 2 has narrowed, students in Senior 3 can still change a great deal in the course of one year or even one semester. Senior 3 teachers need to be sensitive to the dynamic classroom atmosphere and recognize when shifts in interests, capabilities, and needs are occurring, so they can adjust learning experiences for their students.

The chart on the following pages identifies some common characteristics of late adolescence observed in educational studies (Glatthorn, 1993; Maxwell and Meiser, 1997; Probst, 1988) and by Manitoba teachers, and discusses the implications of these characteristics for teachers.

### Senior 3 Learners: Implications for Teachers*

<table>
<thead>
<tr>
<th>Characteristics of Senior 3 Learners</th>
<th>Significance for Senior 3 Teachers</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cognitive Characteristics</strong></td>
<td></td>
</tr>
<tr>
<td>• Most Senior 3 learners are capable of abstract thought and are in the process of revising their former concrete thinking into fuller understanding of principles.</td>
<td>• Teach to the big picture. Help students forge links between what they already know and what they are learning. Be cognizant of individual differences and build bridges for students who think concretely.</td>
</tr>
<tr>
<td>• Students are less absolute in their reasoning, more able to consider diverse points of view. They recognize that knowledge may be relative to context.</td>
<td>• Focus on developing problem-solving and critical thinking skills, particularly those related to STSE and decision making.</td>
</tr>
<tr>
<td>• Many basic learning processes have become automatic by Senior 3, freeing students to concentrate on complex learning.</td>
<td>• Identify the knowledge, skills, and strategies that students already possess, and build the course around new challenges. Through assessment, identify students who have not mastered learning processes at Senior 3 levels and provide additional assistance and support.</td>
</tr>
<tr>
<td>• Students have a clearer self-understanding and have developed specialized interests and expertise. They need to connect what they are learning to the world outside the school. Physics must be seen as valuable and necessary.</td>
<td>• Use strategies that enhance students’ metacognition. Encourage students to develop scientific skills through exploring areas of interest. Cultivate classroom experts and invite students with individual interests to enrich the learning experience of the class.</td>
</tr>
</tbody>
</table>

<tr>
<th>Characteristics of Senior 3 Learners</th>
<th>Significance for Senior 3 Teachers</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Psychological and Emotional Characteristics</strong></td>
<td><strong>Provide choice. Allow students to select many of the resources they will explore and the forms they will use to demonstrate their learning. Collaborate with students in assessment. Teach students to be independent learners. Gradually release responsibility to students.</strong></td>
</tr>
<tr>
<td>• It is important for Senior 3 students to see that their autonomy and emerging independence are respected. They need a measure of control over what happens to them in school.</td>
<td></td>
</tr>
<tr>
<td>• Students are preparing for senior leadership roles within the school and may be more involved with leadership in their communities.</td>
<td></td>
</tr>
<tr>
<td>• Students need to understand the purpose and relevance of practices, policies, and processes. They may express their growing independence through a general cynicism about authority and institutions.</td>
<td></td>
</tr>
<tr>
<td>• Senior 3 students have a clearer sense of identity than they had previously and are capable of being more reflective and self-aware. Some students are more willing to express themselves and disclose their thoughts and ideas.</td>
<td></td>
</tr>
<tr>
<td><strong>Physical Characteristics</strong></td>
<td><strong>Provide students with leadership opportunities within the classroom and with a forum to practise skills in public speaking and group facilitation.</strong></td>
</tr>
<tr>
<td>• Many Senior 3 students have reached adult physical stature. Others, particularly males, are still in a stage of extremely rapid growth and experience a changing body image and self-consciousness.</td>
<td></td>
</tr>
<tr>
<td>• By Senior 3, students are better able to sit still and concentrate on one learning task for longer periods, but they still need interaction and variety. They have a great deal of energy.</td>
<td></td>
</tr>
<tr>
<td>• Senior 3 students still need more sleep than adults, and may come to school tired as a result of part-time jobs or activity overload.</td>
<td><strong>Use students’ tendency to question social mores to help them develop critical thinking. Negotiate policies and demonstrate a willingness to make compromises. Use students’ questions to fuel classroom inquiry.</strong></td>
</tr>
<tr>
<td><strong>(continued)</strong></td>
<td><strong>Provide optional and gradual opportunities for self-disclosure. Invite students to explore and express themselves through their work. Celebrate student differences.</strong></td>
</tr>
</tbody>
</table>
## Senior 3 Learners: Implications for Teachers (continued)

<table>

<th>Significance for Senior 3 Teachers</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Moral and Ethical Characteristics</strong></td>
<td><strong>Moral and Ethical Characteristics</strong></td>
</tr>
<tr>
<td>• Senior 3 students are working at developing a personal ethic, rather than following a prescribed set of values and code of behaviour.</td>
<td>• Explore the ethical meaning of situations in life and in scientific contexts. Provide opportunities for students to reflect on their thoughts in discussion, writing, or representation.</td>
</tr>
<tr>
<td>• Students are sensitive to personal or systemic injustice but are increasingly realistic about the factors affecting social change.</td>
<td>• Explore ways decision-making activities can effect social change, and link to the continuum of science, technology, society, and the environment.</td>
</tr>
<tr>
<td>• Students are shifting from an egocentric view of the world to one centred in relationships and community. They are able to recognize different points of view and adapt to difficult situations.</td>
<td>• Provide opportunities for students to make and follow through on commitments and to refine their interactive skills.</td>
</tr>
<tr>
<td>• Students are becoming realistic about the complexities of adult responsibilities but resist arbitrary authority.</td>
<td>• Explain the purpose of every learning experience. Enlist student collaboration in developing classroom policies. Strive to be consistent.</td>
</tr>
<tr>
<td><strong>Social Characteristics</strong></td>
<td><strong>Social Characteristics</strong></td>
</tr>
<tr>
<td>• By Senior 3, certain individuals will take risks in asserting an individual identity. Many students, however, continue to be intensely concerned with how peers view their appearance and behaviour. Much of their sense of self is drawn from peers, with whom they may adopt a “group consciousness” rather than making autonomous decisions.</td>
<td>• Ensure that the classroom has an accepting climate. Model respect for each student. Use learning experiences that foster student self-understanding and self-reflection. Challenge students to make personal judgements about situations in life and in their natural environment.</td>
</tr>
<tr>
<td>• Adolescents frequently express identification with peer groups through slang, musical choices, clothing, body decoration, and behaviour.</td>
<td>• Foster a classroom identity and culture. Ensure that every student is included and valued. Structure learning so that students can interact with peers, and teach strategies for effective interaction.</td>
</tr>
<tr>
<td>• Crises of friendship and romance, and a preoccupation with relationships, can distract students from academics.</td>
<td>• Open doors for students to study personal relationships in science (for example, through biographies of scientists). Respect confidentiality, except where a student’s safety is at risk.</td>
</tr>
<tr>
<td>• Students begin to recognize teachers as individuals and welcome a personal connection.</td>
<td>• Nurture and enjoy a relationship with each student. Try to find areas of common interest with each one. Respond with openness, empathy, and warmth.</td>
</tr>
</tbody>
</table>
Fostering a Will to Learn: Creating Links between Language and Science

Experiences of intense involvement are optimal opportunities to teach engagement in learning, and teachers should try to ensure they happen frequently in the classroom. Not every learning task, however, can be intrinsically rewarding to every learner. Being a successful learner also requires a high degree of what Corno and Randi (1997) call “sustained voluntary effort”—an attitude expressed in committing oneself to less interesting tasks, persisting in solving problems, paying conscientious attention to detail, managing time, self-monitoring, and making choices between competing values, such as the desire to do well on a homework assignment and the desire to spend the evening with friends. The willingness to make this sustained effort constitutes motivation.

Motivation is a concern of teachers, not only because it is essential to classroom learning, but also because volition and self-direction are central to lifelong learning. Science courses seek to teach students how to interpret and analyze science concepts, and to foster the desire to do so. Motivation is not a single factor that students either bring or do not bring to the classroom. It is multi-dimensional, and individual, and often comprises both intrinsic and extrinsic elements. Students hold certain presuppositions about science learning that affect the way they learn. Teachers can promote certain attitudes and skills to facilitate students’ engagement in each learning task, while recognizing and affirming entry-level abilities.

In considering how they can foster motivation, teachers may explore students’ appreciation of the value (intrinsic and extrinsic) of learning experiences and their belief about their likelihood of success. Good and Brophy (1987) suggest that these two elements can be expressed as an equation; the effort students are willing to expend on a task is a product of their expectation of success and of the value they ascribe to success.

</table>

Teachers may, therefore, want to focus on ensuring students are able to succeed if they apply reasonable effort, and on helping students recognize the value of classroom learning experiences. The following chart provides teachers with suggestions for fostering motivation.
## Fostering Motivation*

<table>
<thead>
<tr>
<th>Ways to Foster Expectations of Success</th>
<th>Best Practice and Research</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Help students to develop a sense of self-efficacy.</td>
<td>• Schunk and Zimmerman (1997) found that students who have a sense of self-efficacy are more willing to participate, work harder, persist longer when they encounter difficulties, and achieve at a higher level than students who doubt their learning capabilities. Teachers foster student self-efficacy by recognizing that each student can succeed, and communicating that belief to the student. Silver and Marshall (1990) found that a student’s perception that he or she is a poor learner is a strong predictor of poor performance, overriding natural ability and previous learning. All students benefit from knowing that the teacher believes they can succeed and will provide the necessary supports to ensure that learning takes place. Teachers also foster a sense of self-efficacy by teaching students that they can learn how to learn. Students who experience difficulty often view the learning process as mysterious and outside their control. They believe that others who succeed in school do so entirely because of natural, superior abilities. It is highly motivating for these students to discover that they, too, can learn and apply the strategies that successful students use when learning.</td>
</tr>
<tr>
<td>• Help students to learn about and monitor their own learning processes.</td>
<td>• Research shows that students with high metacognition (students who understand how they learn) learn more efficiently, are more adept at transferring what they know to other situations, and are more autonomous than students who have little awareness of how they learn. Teachers enhance metacognition by embedding, into all aspects of the curriculum, instruction in the importance of planning, monitoring, and self-assessing. Turner (1997) found that teachers foster a will to learn when they support “the cognitive curriculum with a metacognitive and motivational one” (p. 199).</td>
</tr>
<tr>
<td>• Assign tasks of appropriate difficulty, communicating assessment criteria clearly, and ensuring that students have clear instruction, modelling, and practice so they can complete the tasks successfully.</td>
<td>• Ellis et al. (1991) found that systemic instruction helps students learn strategies they can apply independently (see Instructional Strategies, Section 2, p. 33).</td>
</tr>

Creating a Stimulating Learning Environment

A vital science class grows out of, and is reflected in, a stimulating and inviting physical environment. While the resources and physical realities of classrooms vary, a well-equipped science classroom offers or contains a variety of resources that help stimulate learning. It is helpful to involve students in the classroom design.

Ways to create a stimulating learning environment include the following:

- **Flexible Seating Arrangements**: Use moveable desks or tables to design seating arrangements that reflect a student-centred philosophy and that allow students to interact in various configurations.
• **A Media-Rich Environment**: Have a classroom library of books for self-selected reading. The classroom library may include science periodicals, newspaper articles, newsletters, Internet articles, science-fiction literature, and students’ published work. It may also include a binder of student reviews and recommendations, and may be decorated by student-designed posters or book jackets. Classroom reference materials could include dictionaries/encyclopedias of science, books of facts, software and CD-ROM titles, past exams collated into binders, and manuals.

• **Access to Electronic Equipment**: Provide access to a computer, television, video cassette recorder/DVD-Rom, and video camera, if possible.

• **Wall Displays**: Exhibit posters, Hall of Fame displays, murals, banners, and collages that celebrate student accomplishments. Change these regularly to reflect student interests and active involvement in the science classroom.

• **Display Items and Artifacts**: Have models, plants, photographs, art reproductions, maps, newspaper and magazine clippings, fossils, musical instruments, et cetera, in your classroom to stimulate inquiry and to express the link between the science classroom and the larger world.

• **Communication**: Post checklists, processes, and strategies to facilitate and encourage students’ independent learning. Provide a bulletin board for administrative announcements and schedules.

**Language Learning Connected to Science**

Science curricula involve all aspects of language and literacy development. Halliday suggests that as students actively use the language arts, they engage in three kinds of language learning, which can be linked to broader scientific literacy (Strickland and Strickland, 1997).

• **Students Learn Language**: Language learning is a social process that begins at infancy and continues throughout life. Language-rich environments enhance and accelerate the process. Terminology-rich science has a role in new language development.

• **Students Learn through Language**: As students listen, read, or view, they focus primarily on making meaning from the text at hand. Students use language to increase their knowledge of the world.

• **Students Learn about Language**: Knowledge of language and how it works is a subject in and of itself; nevertheless, science as a discipline of inquiry relies on a particular use of language for effective communication. Consequently, students also focus on language arts and its role when applied to science. Scientific literacy learning is dynamic and involves many processes. The following graphic identifies some of the dynamic processes that form the foundation for effective literacy learning in science classrooms.
Ethical Issues

The development of topics within Senior 3 Physics should lead to issues and questions that go beyond the traditional curriculum. For example, medical biophysics, or the implementation of international protocols related to the prospects of global climate change, raise questions of ethics, values, and responsible use of the products of the physical sciences. The environmental consequences of the industrial applications of chemistry, or the atmospheric physics of climate change, raise issues of considerable importance, as do the topics of nuclear waste disposal and weapons procurement. These are among the important issues that science is often called upon for advice. As students and teachers address these issues, they will naturally be drawn to the study of the underlying scientific concepts. Students should realize that science only provides the background for informed personal and social decisions, and that, as
informed decision makers, they may have an impact on society and the world. Students of physics are not immune to the importance of these aspects of science in a modern, post-industrial world.

Some students and parent(s) may express concern because the perspectives of current science conflict with personal systems of belief. These individuals have a right to expect that science and the public educational system will respect those beliefs, though this does not preclude such issues arising in the classroom. Teachers should explain to students that science is one way of learning about the universe and our unique place embedded in it, and that other explanations, in addition to those of the traditional western sciences, have been put forth—particularly in the realm of cosmogony.

Diversity in the Classroom

Students come from a variety of backgrounds and have distinct learning requirements, learning and thinking approaches, and prior knowledge and experiences. Their depth of prior knowledge varies, reflecting their experiences inside and outside the classroom. Some entry-level knowledge held by students may be limited or incorrect, impeding new learning. For new learning to occur, it is important for teachers to activate prior knowledge, correct misconceptions, and encourage students to relate new information to prior experiences.

Manitoba’s cultural diversity provides opportunities for embracing a wealth of culturally significant references and learning resources in the Senior Years science classroom. Students from various backgrounds bring socially constructed meanings, references, and values to science learning experiences, as well as their unique learning approaches. As noted in Senior Years Science Teachers’ Handbook, “To be effective, the classroom must reflect, accommodate, and embrace the cultural diversity of its students” (Manitoba Education and Training, 1997).

In addition, cultural influences can affect how students think about science: reasoning by analogy or by strict linear logic; memorization of specific correct responses or generalization; problem solving by induction or by deduction; or needing to learn through hands-on apprenticeship to gain one aspect of a skill before moving on to the next step (Kolodny, 1991). Cultural prohibitions permeate some societies; for example, values that discourage assertiveness, outspokenness, and competitiveness in some cultures can result in behaviour that can be interpreted as being indifferent, having nothing to say, or being unable to act decisively (Hoy, 1993; NRC, 1997). The problems engendered by these cultural differences are often beyond the ability of teachers of advanced courses to handle on their own. In many such cases, support from other members of the school staff is essential.
Learning Resources

Traditionally, the teaching of science in Senior Years has largely been a textbook-centred enterprise. The use of a single textbook as the sole resource for the teaching and learning of science severely restricts the development of knowledge, skills, and attitudes that are critical for today’s students. Furthermore, it promotes the idea that all answers are enshrined in a textbook. The successful implementation of Senior 3 Physics depends on a resource-based learning approach, in which textbooks are used only as one of many reference sources. Research suggests that we should provide a wide range of learning resources for structuring teaching and learning experiences. These include human resources, textbooks, magazines/journals, films, audio and video recordings, computer-based multimedia resources, the Internet, and other materials.

Resources referenced in this curriculum include print reference material such as Senior Years Science Teachers’ Handbook: A Teaching Resource (Manitoba Education and Training, 1997) and Science Safety: A Kindergarten to Senior 4 Resource Manual for Teachers, Schools, and School Divisions (Manitoba Education and Training, 1997). In addition, numerous articles from the physics education research community are recommended to teachers.

The choice of learning resources, such as text(s), multimedia learning resources (including video, software, CD-ROMs, microcomputer-based laboratory [MBL] probeware, calculator-based laboratory [CBL] probeware), and websites, will depend on the topic, the local situation, reading level of the students, background of the teacher, community resources, and availability of other materials. A concerted effort should be made to use appropriate learning resources from a wide variety of sources, as not all curricular outcomes can be achieved by using any one resource in the study of a particular topic.

To help teachers and principals select learning resources for Senior 3 and Senior 4 physics, Manitoba Education and Youth has recently published Physics 30S and Physics 40S Learning Resources: Annotated Bibliography: A Reference for Selecting Learning Resources (2003). This annotated bibliography is published online at:

Using This Curriculum Document

Physics curricula in the past have been primarily focussed on presenting a breadth of knowledge (that is, a large amount of content) deemed essential, and with a focus on the mathematical manipulation of algorithms. While this curriculum continues to be concerned with students acquiring relevant knowledge and appropriate mathematical treatment of concepts, it is also concerned both with fostering the development of various skills (context-based process skills, decision-making skills, problem-solving skills, laboratory experimental skills, critical thinking skills, independent learning skills), and with effecting a change of viewpoint. A strong focus of Senior 3 Physics is to link science to the experiential life of the students.
By offering a multidisciplinary focus where appropriate, Senior 3 Physics provides a new set of foundations for fostering increased scientific literacy. The curriculum, consisting of 29 General Learning Outcomes (GLOs), each with a number of Specific Learning Outcomes (SLOs) linked to them, will build upon what students know and are able to do as a result of their studies in Kindergarten to Senior 2 Science (see Figure 6: Kindergarten to Senior 2 Topic Chart, Section 1, page 16).

Senior 3 Physics assumes 110 hours of instructional time, and is designed to include formal assessments, field excursions, and related co-curricular efforts.

Effective Teaching in Physics: What the Research Says to Teachers

Findings of Research on How Students Learn

A number of summaries of the instructional implications of recent research on learning have been prepared. The National Research Council report How People Learn: Brain, Mind, Experience, and School: Expanded Edition (Bransford et al., 2000) can be adapted and elaborated specifically for the study of physics. That report leads to the following implications for effective physics instruction.

1. Effective teachers draw out and work with students’ current understandings, including those understandings students bring with them to the course and those they develop as the course progresses.

There is an emerging consensus in science education research, including a substantial body of work specific to introductory physics, that, to be effective, instruction must elicit, engage, and respond substantively to student understandings (Champagne, Gunstone, and Klopfer, 1985; Clement, 1983; Hake, 1998; Hestenes, Wells, and Swackhamer, 1992; McDermott and Redish, 1999). There are now a number of examples of curricula and materials designed to support interaction with students’ prior understandings, and there is evidence that these approaches can achieve progress in understanding that is not possible for most students with traditional methods.

2. Effective teachers address students’ metacognitive skills, habits, and epistemologies.

Students need to understand not only the concepts of physics, but also the nature of knowledge and learning (Hammer, 1995; Hewson, 1985; McDermott, 1991; Reif and Larkin, 1991; White and Frederiksens, 1998). Many students arrive at physics courses, including advanced-treatment courses such as Physics AP, expecting to learn by memorizing formulas disconnected from each other, as well as from the students’ experiences of the physical world. Effective instruction challenges these expectations, helping students to see physics learning as a matter of identifying, applying, and refining their current understanding. Students learn to examine assumptions hidden in their reasoning; to monitor the quality and consistency of their understanding; to formulate, implement, critique, and refine models of physical phenomena; and to make use of a spectrum of appropriate representational tools. By the end of a physics course, students develop a rich
sense of the coherent, principled structure of physics and are both able and inclined to apply those principles in unfamiliar situations. In short, effective instruction should work toward the objectives identified in the *Manitoba Foundations for Science Literacy*.

3. **Effective teachers are sophisticated diagnosticians of student knowledge, reasoning, and participation.**

   How teachers respond to student thinking depends critically on what they perceive in that thinking, on what they interpret to be the strengths and weaknesses of the students’ understanding and approach. Effective teachers continually gather information to support this ongoing assessment from several different sources: written work on assignments, tests, and quizzes; classroom discussions; and contact with students outside the classroom. They ask students to explain their reasoning throughout their work, particularly through the appropriate and measured use of differentiated instruction techniques. Upon gaining new insights into student understanding, effective teachers adapt their instructional strategies and assessments.

4. **Effective teachers teach a smaller number of topics in greater depth, providing many examples in which the same concept is at work.**

   This is a common refrain in findings from education research, often expressed in the slogan “less is more.” In part, this finding is an implication of the previous two: drawing out and working with student understandings and addressing metacognitive skills and habits all take time, and this necessitates a reduction in the breadth of coverage. Education research also suggests that coming to understand a concept requires multiple encounters in multiple contexts. This finding is reflected across innovations in this physics curriculum that have drawn on the “spiralling” approach fostered throughout all Kindergarten to Senior Years science in Manitoba.

**Making Interdisciplinary Connections in the Physics Classroom**

An important issue for a field as ancient as physics is how it adapts to the needs of society in a given place and time. The field of physics today faces a period of transition.

- A period in which technology and knowledge-based industries are the primary drivers of the national economy has begun.
- A period in which other areas of science, such as microbiology and genetics, will undergo rapid progress has also begun.
- The increasing availability, power, and sophistication of computational hardware and software will make possible novel quantitative descriptions of the physical universe. Society in general appears to be rapidly becoming more and more knowledge based. Enormous quantities of information are instantly available on ubiquitous computers.

Physicists will need to be able to apply the body of knowledge developed within physics to totally new areas. In other words, physicists will be asked to become more interdisciplinary; they will have to apply their special knowledge and methods to problems that cross the boundaries of traditional disciplines.
On the other hand, the topics that possess several features that naturally allow students to begin to confront interdisciplinary issues are welcome, and align more closely to the new emphases outlined in the *Manitoba Foundations for Science Literacy*. First, there is the provision for interdisciplinary options (biomedical physics, historical physics, the nature of science as seen through physics, et cetera) that teachers may choose to create. Collaborative group work of students creates its interdisciplinary dimension through ownership of a collaborative scientific investigation. Such projects can easily involve applying knowledge and methods from several different scientific fields. Increased interdisciplinary content could be added to physics courses by developing more contexts such as the biomedical physics unit mentioned above. Alternatively, the enriched physics course might choose to explore examples illustrating how fundamental physical principles apply to a wide variety of areas. For example, the elastic properties of DNA molecules might be used to discuss the range of validity of Hooke’s law for spring forces. Biological cell membranes could be used to construct interesting examples of electrical potential differences and electric fields. In agreement with the National Research Council’s *National Science Education Standards* (NSES) (1996), Manitoba Education and Youth encourages teachers to include some experiences with the interdisciplinary applications of physics when implementing the physics curriculum.

**Unit Development in Physics**

Senior 3 Physics is driven by specific learning outcomes that can be arranged in a variety of groupings. This design empowers teachers to plan appropriate learning experiences based on the nature of their students, school, and community. Teachers are encouraged to seek their own instructional design with the new curriculum, to share approaches and experiences with colleagues, and to use it to develop and extend student experiences and understandings in new ways.

Working with bigger ideas can allow for a more in-depth inquiry. Organizing around a problem or theme will generally present information in the context of real-world applications (Willis, 1992). For instance, the treatment of vector analysis or free-body diagrams—usually taught in isolation as discrete mastery skills—could be better served by presenting these concepts at the time when the context will demand their use. Throughout the year, provide students with opportunities to uncover concepts from among the sciences in a substantial way, and to make coherent connections among them to physics.

Science deals with major themes in which people are already interested or can readily be interested: life and living things, matter, the universe, information, the ‘made-world’. A primary reason, therefore, for teaching science to young people is to pass on to them some of this knowledge about the material world, simply because it is both interesting and important—and to convey the sense of excitement that scientific knowledge brings (Millar and Osborne, 1998).
For teachers adopting a “thematic” or “big ideas from physics” approach to
organizing the course, choosing an effective theme is critical to the success of
such a pathway. Involving students in the selection of a theme (or the
important subcomponents of a compulsory topic) will encourage and motivate
them by recognizing their interests.

A theme should:
• be broad enough for students to find personal areas of interest;
• promote learning;
• have substance and apply to the real world;
• have relevant materials readily available;
• be meaningful and age-appropriate;
• have depth;
• integrate across the disciplines of physics, biology, chemistry, and geo
  sciences; and
• fascinate students (Willis, 1992).

A View of Physics Education: Toward Modes of Representation

Ask your students to respond, in one sentence, to the question “What is
physics?” Responses tend to describe previous experiences with physics content:
“physics is motion” or “physics is the study of energy and matter.” Other
responses are more global: “physics is the study of the universe” or “physics is
the science of all things.” The relationship of mathematics to physics is
predominant; a common lament is “physics is math” or “physics is figuring out
the simple things in everyday life in a mathematically complex way.” These
responses indicate that students see mathematics as the process of physics.
Many see physics as an important aspect of their preparation for an uncertain
future, but with a varying sense of what physics really is and what it could do
for them.

What is physics? Although answers vary, if you consider the various branches of
physics and the underlying principles, a common theme exists. Physics is the
study of relationships in the world we perceive around us. However, those
relationships are embedded in a social and historical context—a set of lenses
through which the relationships are perceived and acted upon. For instance, we
contemplate “something interesting,” then build models to identify fundamental
characteristics to determine how they interact and influence each other. From
these relationships we are able to predict the behaviour of other “interesting
things” that have the same or similar parameters. A major component of
physics, then, is the study of relationships in a variety of different forms. What
makes the study of physics so difficult for so many is that relationships can be
represented in many different ways—and too often in just one manifestation,
the mathematical symbolic relationship. To facilitate teaching and learning, it
is important to understand these modes of representation and their relationship
to each other.
The Modes of Representation
The Visual Mode
To illustrate these modes of representation, consider an example. A 0.5-kg mass is suspended from a spring (Figure 1). If we suspend a 1.0-kg mass and a 1.5-kg mass from identical springs, we perceive the relationship between the force that acts on the spring and the stretch of the spring. This is what we would call the visual mode of representing a relationship. Its basis is in the “real” world and our perceptions of this world.

In the visual mode we formulate a relationship between two variables and then test our hypothesis by observation and experimentation. As the force increases, the stretch increases. Sometimes, we can even determine the exact relationship. In this case, since the masses in Figure 1 line up in a straight line, the applied force and stretch must increase in some predictable proportion.

The visual mode embodies more than conjecture and observation. It incorporates critical and creative thinking as we build and modify models of nature that act as a foundation for our investigations. The “real” world is conceptualized by a set of guiding assumptions we imagine to be true. We may internalize a model to aid this conceptualization, and then we test this model using experiments. A successful model has explanatory and predictive capabilities. A model may incur discrepant events, which may force us to reconsider and modify our model. Our model may be falsified, in which case we abandon the model in search of a more complete and accurate model. For instance, the model of electric charge provides a foundation for the examination
of electric phenomena. Historically, the fluid and particle models of charge accounted for experimental observations. However, as our ideas about the structure of matter evolved, the particle model provided a more reliable, predictive, and robust explanatory model.

Although we can make some general descriptions of relationships (as force increases, stretch increases), we cannot always determine an exact relationship using the visual mode of representation. Therefore, we quantify the characteristics and compare the numbers. This is called the **numerical** mode of representation.

**Numerical Mode**

In the numerical mode of representation, we operationally define fundamental properties and use measurement to collect data. We can then examine the data to determine an exact relationship. The numerical mode dictates an understanding of proportioning and numerical patterns (e.g., if \( F \) doubles, \( X \) doubles, and if \( F \) triples, \( X \) triples). This suggests a direct proportion, and we can formulate our law. However, in most cases, the collection of data results in systematic errors. Determining the relation by inspection of the data can be very difficult. A picture, however, is worth a thousand numbers. Graphing the data usually gives a clearer picture of the relationship. It could be looked upon, for students, as a preparation for examining closely a “picture of the numbers.”

</tbody>
</table>
Graphical Mode

The graphical mode of representation is a mathematical picture of the relationship. Fortunately, there are a limited number of pictures one needs to know to determine relationships. In fact, at the introductory Senior 3 Physics level, it is only necessary to know three pictures: a straight line, a power curve, and an inverse curve. By adjusting the data to “straighten the curve,” we can determine the exact relationship and formulate a law that can be represented in a symbolic manner.
Symbolic Mode

The fourth mode of representation is the *symbolic mode*. We represent the relationship as an algebraic formula, which can be applied to other physical events that are similar in nature.

For instance,

![Diagram showing straightening a curved line to give a linear relationship and the equation \( y = kx^2 \).]

Therefore, we can represent relationships in four different modes: visual, numerical, graphical, and symbolic. In our model of physics education, students are able to function in each mode to demonstrate complete understanding and mastery of the concepts.

The Importance of the Modes of Representation

It is easy to become caught up in a single mode, especially the symbolic, when it comes to the teaching and learning of physics. Students often complain about the number of formulas in their physics course, or even question their purpose. They dutifully memorize equations and notation, learn to substitute for variables, and arrive at numeric solutions. Students and teachers can easily become trapped exclusively within the symbolic mode of representation.

Instruction using the symbolic mode is easy because little or no preparation is required. The teacher, already grounded in mathematical principles, only needs to derive an equation algebraically. This “out of context” treatment of relationships between the physical/conceptual (i.e., visual mode variables) and the symbolic presents tremendous difficulties for most students, including those students who are apparently mathematically competent.

Meaningful connections between the symbolic and physical/conceptual modes are difficult to make in a de-contextual setting. Many teachers’ own instruction in physics was primarily in the symbolic mode and they may never have mediated their own conceptual difficulties. Students taught exclusively in the symbolic mode often know how to arrive at “cookbook” answers, but they rarely understand the physics or retain any of the concepts. In fact, their difficulties rarely focus on physics. Confusion appears because of notation, similar types of equations, various algebraic representations of formulas, and calculations. As soon as physical concepts are necessary, such as in word problems beyond the “plug and slug” variety, success rates decrease dramatically. Research in
physics education, such as Hestenes’ et al. (1992) “Force Concept Inventory” and McDermott and Schaffer’s (1992) circuit tests, indicates that even advanced students cannot operate in the physical/conceptual domain. This, of course, may not be surprising if their instruction has been almost exclusively in the symbolic mode of representation.

Students need to develop their understanding of relationships more completely, and develop skills in each mode of representation. Students should be able to transfer between modes both fluidly and with facility. Moving through the modes is not necessarily done in order. A “real scientist” can begin investigations in any mode and transfer easily through any combination of modes. Students who demonstrate a complete understanding of physical/conceptual relationships should be able to move from mode to mode in any order.

While fluency with the modes of representation provides a solid foundation for physics education, it is, of itself, not complete when it comes to portraying the nature of scientific activity. Albert Einstein, while developing his theory of relativity, conceptualized an hypothesis and then deduced a series of laws symbolically from a set of fundamental assumptions about time and space. He left it to others to observe, then refute or confirm his propositions. Historical perspectives, and an understanding of the nature of science, will move students toward a more philosophically valid treatment of physics.

---

**To Sum Up the Modes of Representation for Physics Teachers**

**Visual:** encourage students to discuss the representations they see and experience

**Numeric:** use student-generated measurements; always in the context of activities

**Graphical:** carefully plot graphs; get the “picture of the numbers,” not “this is a picture of the world”

**Symbolic:** emphasize the concept first, then initially apply formulas as word definitions; only then work “type” problems using formulas; ideally, formulas are memorized only in certain instances
Toward an Instructional Philosophy in Physics

Teaching Senior 3 Physics with a focus on both content and processes should naturally allow for the use of a variety of instructional strategies. These strategies include the collection and analysis of data from both laboratory and field work, group and individual instruction, a diversity of questioning techniques, decision making, problem solving, design process activities, and a resource-based approach to learning. Senior Years science programming should foster critical thinking skills and promote the integration of knowledge and application of facts to real-life situations. Scientific concepts from other Senior Years science courses may become part of the subject matter as the Senior 3 Physics course develops in the classroom. This is a valuable and useful means of reinforcing and validating those concepts as having relevant and contextual applications.
In general, physics is, in part, a way of thinking that has rules for judging the validity of answers applicable to everyday life. It can be portrayed as intense human activity, full of trial and error, that is influenced by cultural priorities and humanistic perspectives. The myth of total objectivity that often permeates scientific dialogue also needs to be exposed and discussed. Among the natural sciences, “scientific truth” is no longer viewed as an objective reality awaiting discovery; rather, it is placed in the context of something always to be sought. In recognition of the tentative nature of current knowledge claims, “scientific truth” is not a goal that can be reached in absolute terms, but can remain as one of the hallmarks of the traditions of scientific practice.

Encourage students to make distinctions between what is observable and testable, as well as the abstract deductions, models, and themes that derive from evolving scientific research and thinking.

Conceptual knowledge in science can also be integrated with principles from other disciplines. Social, historical, and political implications, if included, provide an opportunity for students to develop a facility to communicate ideas effectively through verbal and written expression. Finally, students could be provided with an opportunity to develop an awareness of the options available to them for careers and vocations in the wide diversity of sciences.

Senior 3 Physics, as a component of young people’s whole educational experience, will assist in preparing them for a full and satisfying life in the 21st century. This course will sustain and develop the curiosity of young people about the natural world around them, and build up their confidence in their ability to inquire into its behaviour, now and in the future. It seeks to foster a sense of wonder, enthusiasm, and interest in science so that young people feel confident and competent to engage with everyday scientific and technological applications and solutions. As students study a range of topics through various subdisciplines of physics, they will acquire a broad, general understanding of the important ideas and explanatory frameworks of the field as a whole, including the procedures of scientific inquiry that have had a major impact on our material environment and on our culture. They will develop an appreciation for why these ideas are valued and the underlying rationale for decisions that they may wish, or be advised, to take in everyday contexts, both now and in later life. They will be able to understand, and respond critically to, media reports of issues with a science (particularly a physics-related) component. They will feel empowered to hold and express a personal point of view on issues with a science component that enter the arena of public debate, and perhaps to become actively involved in some of these issues (Millar and Osborne, 1998, p. 12).
Results-Based Learning

In results-based learning, the programming focus is on what students know and can do, rather than on what material is “covered.” The learning outcomes are an elaboration of the knowledge, strategies, and skills and attitudes expected of each Senior 3 Physics student. All programming decisions are directed toward addressing the gap between the students’ present level of performance and the performance specified in the learning outcomes.

<table>

<tr>
<td>• Assessment Tools and Strategies</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The student learning outcomes are not taught separately or in isolation. Nor are they taught consecutively in the order in which they appear in the curriculum documents. Most lessons or units draw on knowledge, strategies, and skills and attitudes addressed in several or all general learning outcomes. In the process of planning, teachers are encouraged to identify the learning outcomes they intend to assess, and link all assessment to the specific learning outcomes.

In implementing results-based curricula, experienced teachers may find that they use many of the instructional strategies and resources they have used previously. However, the nature of results-based learning will reshape their programming in several ways:

• Planning is ongoing throughout the semester or year because instruction is informed by learning requirements that become evident through continuous assessment.

• Some learning outcomes, especially skills and attitudes outcomes, are addressed repeatedly in different ways throughout the school semester or year. As students develop new scientific knowledge, strategies, and skills and attitudes, they need to practise and refine those they have previously experienced.

Varied Instructional Approaches

Teachers wear a number of different “pedagogical hats,” and change their teaching style relative to the cognitive gains, attitudes, and skills demanded of the task at hand. In planning instruction for Senior 3 Physics, teachers may draw upon a repertoire of instructional approaches and methods and use combinations of these in each unit and lesson. Many suggestions are contained in this document.
Instructional approaches may be categorized as:

- direct instruction;
- indirect instruction;
- experiential learning;
- independent study; and
- interactive instruction.

Most teachers draw from all these categories to ensure variety in their classroom learning experiences, to engage students with various intelligences and a range of learning approaches, and to achieve instructional goals.

The following diagram displays instructional approaches and suggests some examples of methods within each approach. Note that the approaches overlap.

**Instructional Approaches**

- **Direct Instruction**
  - Lesson Overviews
  - Guest Speakers
  - Explicit Teaching
  - Instruction of Strategic Processes
  - Modelling
  - Didactic Questioning
  - Demonstrations
  - Mini-Lessons
  - Guides for Reading, Listening, and Viewing

- **Indirect Instruction**
  - Jigsaw Groups
  - Problem Solving
  - Inquiry and Research
  - Reading and Viewing for Meaning
  - Reflective Discussion
  - Gallery Walks
  - Concept Mapping

- **Experiential Learning**
  - Field Trips
  - Simulations
  - Primary Research
  - Games
  - Focussed Imaging
  - Observations
  - Role Playing
  - Surveys

- **Independent Study**
  - Computer-Assisted Instruction
  - Essays
  - Reports
  - Study Guides
  - Learning Contracts
  - Homework
  - Inquiry and Research Projects
  - Learning Centres

Instructional Approaches

In selecting instructional approaches and methods, teachers consider which combination will assist students in achieving the learning outcomes targeted for a particular lesson or unit. Teachers consider the advantages and limitations of the approaches and methods, as well as the interests, knowledge, and skills and attitudes of their students. Some of these elements are represented in the following chart.

<table>
<thead>
<tr>

<td>• Student understanding and retention increase&lt;br&gt;• Hands-on learning may require additional resources and time</td>
</tr>
<tr>
<td><strong>Independent Study</strong></td>
<td>• Student-centred&lt;br&gt;• Teacher guides or supervises students’ independent study, teaches knowledge, skills, and strategies that students require for independent learning, and provides adequate practice</td>
<td>• Accessing and developing student initiative&lt;br&gt;• Developing student responsibility&lt;br&gt;• Developing self-reliance and independence</td>
<td>Students participating in:&lt;br&gt;• Inquiry and research projects&lt;br&gt;• Using a variety of approaches and methods&lt;br&gt;• Computer-assisted instruction&lt;br&gt;• Essays and reports&lt;br&gt;• Study guides&lt;br&gt;• Learning contracts&lt;br&gt;• Homework&lt;br&gt;• Learning centres</td>
<td>• Students grow as independent, lifelong learners&lt;br&gt;• Student maturity, knowledge, skills and strategies are important to success&lt;br&gt;• Student access to resources is essential&lt;br&gt;• Approach may be used flexibly (it may be used with individual students while other students use other approaches)</td>
</tr>
</tbody>
</table>
Phases of Learning
When preparing instructional plans and goals, many teachers find it helpful to consider three learning phases:
• activating (preparing for learning);
• acquiring (integrating and processing learning); and
• applying (consolidating learning).

These phases are not entirely linear but are a useful way of thinking and planning. A variety of activating, acquiring, and applying strategies are discussed in Success for All Learners: A Handbook on Differentiating Instruction (Manitoba Education and Training, 1996).

 Activating (Preparing for Learning)
One of the strongest indications of how well students will comprehend new information is their prior knowledge of the subject. Some educators observe that more student learning occurs during this phase than at any other time. In planning instruction and assessment, teachers develop student learning experiences and select strategies for activating their students’ prior knowledge. Using these activating strategies, the learning experiences then provide information about the extent of students’ prior knowledge of the topic to be studied, their knowledge of and familiarity with the context in which that knowledge was acquired, and their knowledge of and proficiency in applying skills for learning.

Learning experiences that draw on students’ prior knowledge:
• help students relate new information, skills, and strategies to what they already know and can do (e.g., if a text includes unfamiliar vocabulary, students may not recognize the connection between what they know and the new material being presented);
• allow teachers to recognize misconceptions that might make learning difficult for students;
• allow teachers to augment and strengthen students’ knowledge base when students do not possess adequate prior knowledge and experience to engage with new information and ideas;
• help students recognize gaps in their knowledge; and
• stimulate curiosity and initiate the inquiry process that will direct learning.

 Acquiring (Integrating and Processing Learning)
In the second phase of learning, students engage with new information and integrate it with what they already know, adding to and revising their previous knowledge. Part of the teacher’s role in this phase is to present this new information or to help students access it from various resources.
Since learning is an internal process, however, facilitating learning requires more of teachers than simply presenting information. In the acquiring phase, teachers instruct students in strategies that help them make meaning of information, integrate it with what they already know, and express their new understanding. In addition, teachers monitor these processes to ensure that learning is taking place, using a variety of instruments, tools, and strategies such as observations, conferences, and examination of student work.

In practice, within an actual lesson or unit, the acquiring phase of learning may include a series of steps and strategies, such as:

- setting the purpose (e.g., discrepant events, lesson overviews, learning logs, admit slips);
- presenting information (e.g., lab demonstrations, guest speakers, mini-lessons, active reading);
- processing information (e.g., note making, group discussions, journals, visual representations);
- modelling (e.g., role-playing, demonstrations); and
- checking for understanding (e.g., quizzes, informal conferences).

**Applying (Consolidating Learning)**

New learning that is not reinforced is soon forgotten. The products and performances by which students demonstrate new learning are not simply required for assessment; they have an essential instructional purpose in providing students with opportunities to demonstrate and consolidate their new knowledge, skills and strategies, and attitudes. Students also need opportunities to reflect on what they have learned and to consider how new learning applies to new situations. By restructuring information, expressing new ideas in another form, or integrating what they have learned in science with concepts from other subject areas, students strengthen and extend learning.

To ensure that students consolidate new learning, teachers plan various learning experiences involving:

- reflection (e.g., journals, exit slips);
- closure (e.g., sharing of products, debriefing on processes); and
- application (e.g., inquiry, design process).
Differentiating Instruction

How can Senior Years science teachers meet each student’s learning requirements and still make learning experiences challenging and meaningful for all? One way to help all students achieve the prescribed student learning outcomes is to differentiate the instructional strategies. Senior 3 Physics makes reference to a variety of field-validated strategies for differentiating instruction. Most have been taken from the support document *Senior Years Science Teachers’ Handbook* (Manitoba Education and Training, 1997).

Through differentiating instruction, teachers can:

- activate students’ prior knowledge;
- accommodate multiple intelligences and the variety of learning and thinking approaches;
- help students interpret, apply, and integrate information;
- facilitate the transfer of knowledge, skills, and attitudes to students’ daily lives; and
- challenge students to realize academic and personal progress and achievement.

Differentiating instruction does not mean offering different programming to each student. Classroom experiences can be differentiated by offering students choices and by varying instructional and assessment strategies to provide challenging and effective learning experiences for all.

Promoting Strategic Learning

Many of the tasks science students perform are problem-solving tasks, such as finding sources of information for an inquiry project, making meaning of a difficult text, or organizing a body of information. To solve problems, students require a strategic mindset; when confronted with a problem, students survey a number of possible strategies, select the one that seems likely to work best for the situation, and try an alternative method if the first one does not produce results.

Strategic learners in the sciences need to have not only a strategic mindset, but also a repertoire of strategies for making meaning, for processing information, and for expressing ideas and information effectively. Whereas skills are largely unconscious mental processes that learners use in accomplishing learning tasks, strategies are systematic and conscious plans, actions, and thoughts that learners select or invent and adapt to each task. Strategies are often described as “knowing what to do, how to do it, when to do it, and why it is useful.”

---

Scaffolding: Supporting Students in Strategic Learning

Many scientific tasks involve a complex interaction of skills. The most effective way to learn, however, is not by breaking down the tasks into manageable parts and teaching the skills separately and in isolation. In fact, this approach may be counterproductive. Purcell-Gates (1996) uses the analogy of learning to ride a bicycle, a skill that requires children to develop an intuitive sense of balance while also learning to pedal and steer. Children do not learn to ride a bicycle by focussing on only one of these skills at a time. Instead, they observe others who can ride a bicycle successfully, and then make an attempt themselves. In the early stages of learning to ride, a child counts on someone to provide support—to hold the bicycle upright while the child mounts, to keep a hand on the seat to stabilize the bicycle for the first few metres, and to coach and encourage. Gradually, these supports are withdrawn as the rider becomes more competent. Eventually, the process becomes automatic, and the rider is no longer aware of the skills being performed.

Providing this sort of support in teaching is called “scaffolding,” based on the work of Wood, Bruner, and Ross (1976). Teachers scaffold by:

• structuring tasks so that learners begin with something they can do;
• reducing the complexity of tasks;
• calling students’ attention to critical features of the tasks;
• modelling steps; and
• providing sufficient guided and independent practice.

In a sense, each learning strategy is an external support or scaffold. At first, working with a new strategy may be challenging and the main focus of students’ attention. Eventually, students use the strategy automatically and rely on it as a learning tool. Students gradually internalize the process of the strategy. They begin to adjust and personalize the process and to apply the thinking behind the strategy automatically.

In strategic instruction, teachers observe and monitor students’ use of a strategy for a time, intervening where necessary. Students vary in the length of time they require scaffolding. In this respect, strategic instruction is also a useful tool for differentiation. Struggling learners may work with simplified versions of a strategy, and they may continue to use the supports of a strategy (for example, a graphic organizer for laboratory reports) after other students have internalized the process.

Strategic instruction works best when teachers pace the instruction of new strategies carefully (so that students have time to practise each one), and when they teach a strategy in the context of a specific task of relevant scientific experience.
Instructional Strategies

The following outlines instructional strategies that may be used with Senior 3 Physics. The strategies are referenced in the Suggestions for Instruction column of this document.

- **Journal Writing**
  - Science journal writing allows students to explore and record various aspects of their experiences in science class. By sorting out their thoughts on paper or thinking about their learning (metacognition), students are better able to process what they are learning.

- **Class Discussion**
  - Discussions may be used in a variety of ways. They may spark interest in a topic or learning outcome, activate prior knowledge by inviting speculation on why certain events occur, or generate ideas for solutions to problems.

- **Prior Knowledge Activities**
  - Students learn best when they are able to relate new knowledge to what they already know. Brainstorming, KWL charts, and Listen-Think-Pair-Share (see *Senior Years Science Teachers’ Handbook*) are just a few of the strategies that may be used to activate and assess students’ prior knowledge.

- **Student Research/Reports**
  - Learning projects that involve student research are one of the most effective ways to individualize instruction in a diverse classroom. These learning activities provide students with the opportunity to develop their research skills as they gather, process, and evaluate information.

- **Teacher/Student Demonstration**
  - Demonstrations, such as discrepant events, may be used to arouse student interest and allow for visualization of phenomena. Demonstrations can activate prior knowledge and generate discussion about learning outcomes.

- **Visual Displays**
  - When students create visual displays, they make their thinking visible. Generating diagrams, posters, or models provides students with the opportunity to represent abstract information in a more concrete form.

- **Collaborative Teamwork**
  - Instructional strategies, such as the Jigsaw or Roundtable (see *Senior Years Science Teachers’ Handbook*), encourage students to learn from one another and to develop teamwork skills. The use of cooperative learning activities may lead to increased understanding of content and improved thinking skills.
• **Laboratory Activities**
  — Laboratory activities, whether student- or teacher-designed, provide students with the opportunity to apply their scientific knowledge and skills related to a group of learning outcomes. Students appreciate the hands-on experience of doing science.

• **Debates**
  — Debates draw upon students’ own positions on STSE issues. When carefully structured, debates may be used to encourage students’ consideration of societal concerns and the opinions of others, and to improve their communication and research skills.

• **Community Connection**
  — Field trips and guest speakers may provide students with the opportunity to see science applied in their community and local natural environments.

• **Webquests**
  — A Webquest is an inquiry-oriented activity in which most or all the information used by learners comes from resources on the Internet. Webquests are designed to use learners’ time well, to focus on using information rather than looking for it, and to support learners’ thinking at the levels of analysis, synthesis, and evaluation.

• **Problem-Based Learning (PBL)**
  — PBL is a curricular design that centres on an authentic problem. Students are assigned roles and presented with a problem that has no single, clear-cut solution. Students acquire content knowledge as they work toward solving the problem.
