Appendix 1.1A: Developing a Set of Solubility Rules: Lab Activity

Purpose
In this lab activity, you will develop your own procedure to create a set of solubility rules. You will be provided with 0.1 mol/L solutions of various anions and cations so that you can observe whether precipitates are formed.

Solutions
The solutions the class will use include the following:

- **Set A**
  - silver ions (Ag⁺)
  - barium ions (Ba²⁺)
  - sodium ions (Na⁺)
  - ammonium ions (NH₄⁺)
  - calcium ions (Ca²⁺)
  - chloride ions (Cl⁻)
  - carbonate ions (CO₃²⁻)
  - sulphate ions (SO₄²⁻)
  - nitrate ions (NO₃⁻)
  - phosphate ions (PO₄³⁻)

- **Set B**
  - zinc ions (Zn²⁺)
  - iron ions (Fe³⁺)
  - sodium ions (Na⁺)
  - magnesium ions (Mg²⁺)
  - potassium ions (K⁺)
  - chloride ions (Cl⁻)
  - hydroxide ions (OH⁻)
  - bromide ions (Br⁻)
  - carbonate ions (CO₃²⁻)
  - acetate ions (C₂H₃O₂⁻)

Before you begin mixing solutions, set up a grid to organize your observations.

Follow-up Questions
1. Scientists have developed a set of solubility rules with respect to the solubility of anions with numerous cations.
   a) List the cations that did not form any precipitates.
   b) For each anion, list the cations with which it was insoluble (formed a precipitate).
2. List the set of solubility rules that you have developed.
Appendix 1.1B: Developing a Set of Solubility Rules: Lab Activity
(Teacher Notes)

Introduction
Have student groups perform the lab activity using the solutions in either Set A or Set B below and then share their observations.

Where appropriate, 1.0 mol/L solutions can be prepared instead of 0.1 mol/L solutions. Involving students in the preparation of solutions is desirable. It may be clearer for students if the ions that participate in the reactions come from separate solutions. For instance, in Set A, a solution of 0.1 mol/L NaCl could be the source of Na⁺ ions, and 0.1 mol/L Na₂CO₃ acts as the source of CO₃²⁻ ions. These solutions would replace the following solution in Set A below: 2 × 0.1 mol/L solutions of sodium carbonate (Na₂CO₃) labelled Na⁺ and CO₃²⁻. The NH₄Cl is used for the NH₄⁺ ions and the (NH₄)₂SO₄ is used as the source for SO₄²⁻ ions. For Set B, NaCl can be used as a source for sodium ions, and KCl can be used as a source for potassium ions.

If this strategy is not followed, students will no doubt observe “anomalous” precipitates (discrepant events) that were unexpected, and may be difficult to explain. To avoid confusion, teachers are encouraged to proceed according to the level of difficulty desired for students’ explanations of results.

Solutions
Prepare solution sets of 25 mL dropper bottles.

Set A
1 × 0.1 mol/L solution of silver nitrate (AgNO₃) labelled Ag⁺
2 × 0.1 mol/L solutions of barium chloride (BaCl₂) labelled Ba²⁺ and Cl⁻
2 × 0.1 mol/L solutions of sodium carbonate (Na₂CO₃) labelled Na⁺ and CO₃²⁻
2 × 0.1 mol/L solutions of ammonium sulphate ((NH₄)₂SO₄) labelled NH₄⁺ and SO₄²⁻
2 × 0.1 mol/L solutions of calcium nitrate (Ca(NO₃)₂) labelled Ca²⁺ and NO₃⁻
1 × 0.1 mol/L solution of potassium phosphate (K₃PO₄) labelled PO₄³⁻

Set B
1 × 0.1 mol/L solution of zinc acetate (Zn(C₂H₃O₂)₂) labelled Zn²⁺
2 × 0.1 mol/L solutions of iron(III) chloride (FeCl₃) labelled Fe³⁺ and Cl⁻
2 × 0.1 mol/L solutions of sodium hydroxide (NaOH) labelled Na⁺ and OH⁻
1 × 0.1 mol/L solution of magnesium bromide (MgBr₂) labelled Mg²⁺
1 × 0.1 mol/L solution of sodium bromide (NaBr) labelled Br⁻
2 × 0.1 mol/L solutions of potassium carbonate (K₂CO₃) labelled K⁺ and CO₃²⁻
1 × 0.1 mol/L solution of sodium acetate (NaC₂H₃O₂) labelled C₂H₃O₂⁻
Probable Results

PPT = precipitate; NP = no precipitate

1. a) The cations that did not form any precipitates were Na⁺ and NH₄⁺.

b) Cl⁻ formed a precipitate with Ag⁺.

CO₃²⁻ formed a precipitate with Ag⁺, Ba²⁺, and Ca²⁺.

SO₄²⁻ formed a precipitate with Ag⁺, Ba²⁺, and Ca²⁺.

Note: Ag₂SO₄ is sparingly soluble, so students may or may not see a precipitate.

NO₃⁻ did not form a precipitate with any of the cations.

PO₄³⁻ formed a precipitate with Ag⁺, Ba²⁺, and Ca²⁺.

1. a) The cations that did not form any precipitates were Na<sup>+</sup> and K<sup>+</sup>.
   b) Cl<sup>-</sup> did not form a precipitate with any of the cations.
      OH<sup>-</sup> formed a precipitate with Zn<sup>2+</sup>, Fe<sup>3+</sup> and Mg<sup>2+</sup>.
      Br<sup>-</sup> did not form a precipitate with any of the cations.
      CO<sub>3</sub><sup>2-</sup> formed a precipitate with Zn<sup>2+</sup> and Mg<sup>2+</sup>.
      C<sub>2</sub>H<sub>3</sub>O<sub>2</sub><sup>-</sup> did not form a precipitate with any of the cations.

2. Solubility Rules
   a) Most nitrate (NO<sub>3</sub><sup>-</sup>) salts are soluble.
   b) Most salts containing the alkali metal ions (Li<sup>+</sup>, Na<sup>+</sup>, K<sup>+</sup>, Rb<sup>+</sup>, Cs<sup>+</sup>) and the ammonium ion (NH<sub>4</sub><sup>+</sup>) are soluble.
   c) Most chloride (Cl<sup>-</sup>), bromide (Br<sup>-</sup>), and iodide (I<sup>-</sup>) salts are soluble. Notable exceptions are salts containing the ions Ag<sup>+</sup>, Pb<sup>2+</sup>, and Hg<sub>2</sub><sup>2+</sup>.
   d) Most sulphate (SO<sub>4</sub><sup>2-</sup>) salts are soluble. Notable exceptions are BaSO<sub>4</sub>, PbSO<sub>4</sub>, HgSO<sub>4</sub>, and CaSO<sub>4</sub>.
   e) Most hydroxide (OH<sup>-</sup>) salts are only slightly soluble. The important soluble hydroxides are NaOH and KOH. The compounds Ba(OH)<sub>2</sub>, Sr(OH)<sub>2</sub>, and Ca(OH)<sub>2</sub> are marginally soluble.
   f) Most sulphide (S<sup>2-</sup>), carbonate (CO<sub>3</sub><sup>2-</sup>), chromate (CrO<sub>4</sub><sup>2-</sup>), and phosphate (PO<sub>4</sub><sup>3-</sup>) salts are only slightly soluble.

Appendix 1.3: Predicting Precipitation Reactions

Use a solubility rules table to predict precipitation reactions.

a) Predict the products of the reactions in the following examples.

b) Write a balanced molecular equation and check the table for the solubility of the products.

c) Write a total ionic equation.

d) Write a net ionic equation.

Example 1

AlCl₃ reacts with KOH

a) Al³⁺ combines with OH⁻ to form Al(OH)₃ and K⁺ combines with Cl⁻ to form KCl.

b) The balanced molecular equation will be

\[ \text{AlCl}_3(\text{aq}) + 3\text{KOH}(\text{aq}) \rightarrow \text{Al(OH)}_3(\text{s}) + 3\text{KCl}(\text{aq}) \]

Notice from the solubility table that the Al³⁺ ion is insoluble with the OH⁻ ion, thus forming a precipitate.

c) Compounds that are written as aqueous are broken down to their respective cations and anions. Solids are written in molecular form.

\[ \text{Al}^{3+}(\text{aq}) + 3\text{Cl}^-(\text{aq}) + 3\text{K}^+(\text{aq}) + 3\text{OH}^-(\text{aq}) \rightarrow \text{Al(OH)}_3(\text{s}) + 3\text{K}^+(\text{aq}) + 3\text{Cl}^-(\text{aq}) \]

d) Ions that are common to both sides of the reaction are called spectator ions. These ions are cancelled when writing the net ionic equation.

The net ionic equation would be

\[ \text{Al}^{3+}(\text{aq}) + 3\text{OH}^-(\text{aq}) \rightarrow \text{Al(OH)}_3(\text{s}) \]
Appendix 1.3: Predicting Precipitation Reactions (continued)

Example 2
AgNO₃ reacts with CaI₂

a) Ag⁺ combines with I⁻ to form AgI, and Ca²⁺ combines with NO₃⁻ to form Ca(NO₃)₂.

b) The balanced molecular equation will be

\[ 2\text{AgNO}_3(aq) + \text{CaI}_2(aq) \rightarrow 2\text{AgI}(s) + \text{Ca(NO}_3)_2(aq) \]

Notice from the solubility table that the Ag⁺ ion is insoluble with the I⁻ ion, thus forming a precipitate.

c) Compounds that are written as aqueous are broken down to their respective cations and anions. Solids are written in molecular form.

\[ 2\text{Ag}^+(aq) + 2\text{NO}_3^-(aq) + \text{Ca}^{2+}(aq) + 2\text{I}^-(aq) \rightarrow 2\text{AgI}(s) + \text{Ca}^{2+}(aq) + 2\text{NO}_3^-(aq) \]

d) Ions that are common to both sides of the reaction are called spectator ions. These ions are cancelled when writing the net ionic equation.

\[ 2\text{Ag}^+(aq) + 2\text{I}^-(aq) \rightarrow 2\text{AgI}(s) \]

Appendix 1.5: Identifying Unknown Solutions (Teacher Notes and Preparation Guide)

Purpose

Present student groups with four unknown solutions. Their job will be to identify each unknown solution using only a spot plate, a stir stick, a chart showing the colour of ions in aqueous solutions, a table of solubility rules, and the solutions themselves.

Solutions

The sets of solutions that students will use could include 0.1 mol/L solutions of the following:

Set 1: \( \text{Ba(NO}_3\text{)}_2, \text{NaOH, Na}_2\text{CO}_3, \text{CuSO}_4 \)
Set 2: \( \text{Co(NO}_3\text{)}_2, \text{Na}_3\text{PO}_4, \text{Na}_2\text{SO}_4, \text{AgNO}_3 \)
Set 3: \( \text{Cr}_2(\text{SO}_4)_3, \text{MnSO}_4, \text{Ba(NO}_3\text{)}_2, \text{Zn(NO}_3\text{)}_2 \)
Set 4: \( \text{Fe(NO}_3\text{)}_3, \text{KI, Pb(NO}_3\text{)}_2, \text{NaOH} \)
Set 5: \( \text{NiSO}_4, \text{Na}_2\text{CO}_3, \text{MnSO}_4, \text{NaCl} \)
Set 6: \( \text{CuSO}_4, \text{NaCl, Na}_3\text{PO}_4, \text{Zn(NO}_3\text{)}_2 \)

Questions

Students must correctly identify the four solutions and explain how they identified each of the solutions using the solubility rules.

1. Using a chart that shows the colour of common ions in aqueous solutions, can you identify any of your unknowns based on this information? Explain.

2. Which solutions that you mixed formed a precipitate? Can you identify any of the unknown solutions based on this result? Explain.

3. Are there any reactions that have no precipitate formation? Can you identify any of the unknown solutions based on this result? Explain.

Preparation Guide

Prepare 0.1 mol/L solutions of each of the following.

Set 1
Solution 1: 2.613 g of \( \text{Ba(NO}_3\text{)}_2 \) in 100 mL of solution
Solution 2: 0.40 g of NaOH in 100 mL of solution
Solution 3: 1.06 g of \( \text{Na}_2\text{CO}_3 \) in 100 mL of solution
Solution 4: 2.50 g of \( \text{CuSO}_4 \cdot 5\text{H}_2\text{O} \) in 100 mL of solution
Appendix 1.5: Identifying Unknown Solutions (Teacher Notes and Preparation Guide) (continued)

Set 2
Solution 1: 2.91 g of Co(NO₃)₂·6H₂O in 100 mL of solution
Solution 2: 2.90 g of Na₃PO₄·7H₂O in 100 mL of solution
Solution 3: 1.421 g of Na₂SO₄ in 100 mL of solution
Solution 4: 1.699 g of AgNO₃ in 100 mL of solution

Set 3
Solution 1: 3.60 g of Cr₂(SO₄)₃ in 100 mL of solution
Solution 2: 1.69 g of MnSO₄·H₂O in 100 mL of solution
Solution 3: 2.613 g of Ba(NO₃)₂ in 100 mL of solution
Solution 4: 2.97 g of Zn(NO₃)₂·6H₂O in 100 mL of solution

Set 4
Solution 1: 4.04 g of Fe(NO₃)₃·9H₂O in 100 mL of solution
Solution 2: 1.66 g of KI in 100 mL of solution
Solution 3: 3.312 g of Pb(NO₃)₂ in 100 mL of solution
Solution 4: 0.40 g of NaOH in 100 mL of solution

Set 5
Solution 1: 2.63 g of NiSO₄·6H₂O in 100 mL of solution
Solution 2: 1.06 g of Na₂CO₃ in 100 mL of solution
Solution 3: 1.69 g of MnSO₄·H₂O in 100 mL of solution
Solution 4: 0.584 g of NaCl in 100 mL of solution

Set 6
Solution 1: 2.50 g of CuSO₄·5H₂O in 100 mL of solution
Solution 2: 0.584 g of NaCl in 100 mL of solution
Solution 3: 2.90 g of Na₃PO₄·7H₂O in 100 mL of solution
Solution 4: 2.97 g of Zn(NO₃)₂·6H₂O in 100 mL of solution

Appendix 1.7A: Titration: Lab Activity

Purpose
Titrations are procedures that are usually used to determine the unknown concentrations of substances. In this lab activity, you will add drops of a known concentration of sodium hydroxide to a beaker containing a known concentration of sulphuric acid until neutralization occurs. The number of moles of each reactant can then be calculated from the volumes present, so that their ratio can be compared to the ratio of coefficients in the balanced equation.

Materials
- 50 mL beaker
- three micropipettes
- phenolphthalein indicator
- 10 mL graduated cylinder
- distilled water
- 0.1 mol/L sodium hydroxide (NaOH)
- 0.1 mol/L sulphuric acid (H₂SO₄)

Procedure
1. Using the 10 mL graduated cylinder and a micropipette, count and record the number of drops required to obtain 1.0 mL of distilled water. Perform this process a total of three times.
   Note: For the best, most reproducible results, hold the micropipette vertically, and squeeze the bulb slowly and gently. Avoid introducing air bubbles into the stem of the pipette, as they will result in half or quarter drops.

2. Add 5 mL of distilled water and one drop of phenolphthalein indicator to a 50 mL beaker. Swirl the beaker well.

3. Using a second micropipette (to avoid contamination of the solutions), add 20 drops of 0.1 mol/L H₂SO₄ to the beaker. Swirl the solution carefully.

4. Using a third micropipette, add the 0.1 mol/L NaOH drop by drop, until the addition of one drop of the base permanently changes the colour of the solution. Be sure to swirl the beaker gently after each drop is added. Record the number of drops required to reach the endpoint of the titration.
   Note: The endpoint of the titration occurs when one drop of an acid or a base permanently changes the colour of the indicator used in the titration.

5. Rinse the contents of the beaker down the sink with plenty of water (the final rinse should be with distilled water), and perform steps 2 through 4 a total of three times.
Note: The trials should agree with one another to within one drop. If you make a mistake, miss the endpoint, or lose count of the drops, perform another trial. Do not erase the results, but make note of what went wrong.

Qualitative Observations
- Describe each solution before reaction occurs.
- Describe the solution after adding the drops of phenolphthalein.

</table>
Calculations

1. Write a balanced molecular equation for the reaction.
2. Draw a particulate representation of the balanced reaction.
3. Calculate the average number of drops required to obtain 1.0 mL of distilled water.
4. Using the data obtained in step 2 of the procedure, calculate the volume of NaOH added in each trial.
5. Calculate the average number of moles of NaOH required to neutralize the sample of H₂SO₄.
6. Using the data obtained in step 2, calculate the volume of H₂SO₄ added in each trial.
7. Using your balanced equation, determine the average number of moles present in the sample of H₂SO₄.
8. Use the coefficients in the balanced equation to determine the ratio of moles between the sodium hydroxide and the sulphuric acid.
9. Use the number of moles obtained in steps 4 and 5 of the procedure to determine the ratio of moles between the sodium hydroxide and the sulphuric acid.

Conclusion

State the stoichiometric relationship between the sodium hydroxide and the sulphuric acid.

Questions

1. a) Write a balanced molecular equation for the reaction between barium hydroxide and sulphuric acid.
   b) Use the coefficients in the balanced equation to calculate the volume of barium hydroxide required to react with 20 mL of sulphuric acid.
2. a) Write a balanced molecular equation for the reaction between aluminum hydroxide and sulphuric acid.
   b) Use the coefficients in the balanced equation to calculate the volume of aluminum hydroxide required to react with 30 mL of sulphuric acid.

Sources of Error

What possible errors could have occurred in your lab activity?
Appendix 1.7B: Titration: Lab Activity (Teacher Notes)

Purpose
To demonstrate the stoichiometry of a neutralization reaction between a strong acid and a strong base.

Qualitative Observations
- Distilled water: clear, colourless liquid
- Sulphuric acid: clear, colourless liquid
- Sodium hydroxide: clear, colourless liquid
- Phenolphthalein: clear, colourless liquid

Appendix 1.7B: Titration: Lab Activity (Teacher Notes) (continued)

Calculations
1. \[2\text{NaOH}_{(aq)} + \text{H}_2\text{SO}_4_{(aq)} \rightarrow \text{Na}_2\text{SO}_4_{(aq)} + 2\text{H}_2\text{O}_(l)\]
2. Molecule size is not a true representation of the actual size of the compound.

\[\frac{(23 + 24 + 23)}{3} = 23.3 \text{ drops}\]

4. volume \(\text{NaOH} = (1 \text{ mL}/23.3 \text{ drops}) \times 69 \text{ drops} = 2.96 \text{ mL of NaOH}\)
5. moles \(\text{NaOH} = 0.10 \text{ mole/L} \times 2.96 \times 10^{-3} \text{ L} = 0.000296 \text{ moles NaOH}\)
6. volume \(\text{H}_2\text{SO}_4 = (1 \text{ mL}/23.3 \text{ drops}) \times 20 \text{ drops} = 0.858 \text{ mL of H}_2\text{SO}_4\)
7. moles \(\text{H}_2\text{SO}_4 = 0.10 \text{ mole/L} \times 0.858 \times 10^{-3} \text{ L} = 0.0000858 \text{ moles H}_2\text{SO}_4\)
8. coefficient \(\text{NaOH}/\text{coefficient H}_2\text{SO}_4 = 2/1 = 2\)
9. moles \(\text{NaOH}/\text{moles H}_2\text{SO}_4 = 0.000296/0.0000858 = 3.45\)

Conclusion
Answers will vary. For example, the stoichiometric relationship between the sodium hydroxide and the sulphuric acid in the balanced equation is 2 to 1, while the experimental relationship is 3.45 to 1.

Questions
1. a) \(\text{Ba(OH)}_2_{(aq)} + \text{H}_2\text{SO}_4_{(aq)} \rightarrow \text{BaSO}_4_{(aq)} + 2\text{H}_2\text{O}_(l)\)
   b) The volume of barium hydroxide required to react with 20 mL of sulphuric acid is 20 mL.
2. a) \(2\text{Al(OH)}_3_{(aq)} + 3\text{H}_2\text{SO}_4_{(aq)} \rightarrow \text{Al}_2(\text{SO}_4)_3_{(aq)} + 6\text{H}_2\text{O}_(l)\)
   b) The volume of aluminum hydroxide required to react with 30 mL of sulphuric acid is 20 mL.

Sources of Error
Sources of error could include calibration of the micropipette and graduated cylinder, as well as the accuracy of the concentrations of the solutions used.

</tbody>
</table>
Purpose
Chemists, like detectives, attempt to identify unknowns through a process of careful and creative analysis. This usually involves observing the colours, odours, and reactions of unknown substances and comparing them with those of known substances. In this experiment, you will try to identify 12 different chemical compounds by reacting them with each other, observing the results, and comparing the results with the known characteristics of some common chemicals.

Chemical Compounds
The 12 chemicals used in this experiment are listed below (in no particular order):
- potassium chromate (K$_2$CrO$_4$)
- aluminum chloride (AlCl$_3$)
- sodium carbonate (Na$_2$CO$_3$)
- sodium acetate (NaCH$_3$COO)
- hydrochloric acid (HCl)
- sodium hydroxide (NaOH)
- ammonium hydroxide (NH$_4$OH)
- iron(III) nitrate (Fe(NO$_3$)$_3$)
- silver nitrate (AgNO$_3$)
- copper(II) sulphate (CuSO$_4$)
- nickel(II) chloride (NiCl$_2$)
- lead(II) nitrate (Pb(NO$_3$)$_2$)

Research and Plan
Before starting the lab activity, you will have to do extensive research on the characteristic colours of the solutions, any distinguishing odours, their flame-test colours, and the colours of any precipitates that may be created through the combination of each different species. Your written plan must include a data table grid that includes each species, the solution and flame-test colours, the colours of potential precipitates, and any other information that you think will help to identify your unknowns.
Materials
On the day of the lab activity, you will be provided with the following materials:
- 12 test tubes containing 8 mL each of different solutions
- well plates
- stir sticks
- cotton swabs/flame-test wires/moist wooden splints
- Bunsen burners
- matches
- litmus paper
- 10 micropipettes
- gloves
- distilled water

Avoid running out of your samples, as you will not be provided with any more. Do not assume that solution sets other groups are using are numbered in the same way—they are not!

Lab Write-up
After recording all your observations in the lab activity, you will attempt to identify each of the unknowns. A formal lab write-up must include a logical explanation of how you determined the identity of each test tube. This will include net ionic equations for any precipitates you saw.

Caution
All solutions must be treated as if they were poisonous and corrosive. Avoid inhaling any fumes. Some reactions may occur very quickly, while others will occur more slowly. Observe each reaction for at least two minutes before disposing of the products. Gas evolution (bubbling) will be immediate. Rinse off your stir stick after each use. As time will be limited, use your time wisely.
Teachers can prepare the solutions for this lab activity in advance or have students prepare them. Prepare a solution, given the amount of solute (in grams) and the volume of solution (in millilitres), and determine the concentration in moles/litre.

**Materials**
- well plates
- stir sticks
- cotton swabs/flame-test wires/moist wooden splints
- Bunsen burners
- matches
- litmus paper
- micropipettes (10 per group)
- gloves
- distilled water
- test tube rack
- test tubes (12 x 10/group = 120 test tubes)
- test tube stoppers or plastic wrap to cover the test tubes

100 mL solutions of the following 12 solutions:

0.2 mol/L K₂CrO₄—to prepare, dissolve 3.88 g of K₂CrO₄ in 100 mL of distilled water
1.0 mol/L AlCl₃·6H₂O—dissolve 24.14 g of AlCl₃ in 100 mL of distilled water
1.0 mol/L Na₂CO₃—dissolve 10.6 g of Na₂CO₃ in 100 mL of distilled water
1.0 mol/L NaCH₃COO·3H₂O—dissolve 13.61 g of NaCH₃COO in 100 mL of distilled water
6.0 mol/L HCl—mix 49.6 mL in 100 mL of distilled water
6.0 mol/L NaOH—dissolve 24.0 g of NaOH in 100 mL of distilled water
6.0 mol/L NH₄OH—mix 40.5 mL in 100 mL of distilled water
0.1 mol/L Fe(NO₃)₃·9H₂O—dissolve 4.04 g of Fe(NO₃)₃·9H₂O in 100 mL of distilled water
0.1 mol/L AgNO₃—dissolve 1.70 g of AgNO₃ in 100 mL of distilled water
0.1 mol/L CuSO₄—dissolve 2.50 g of CuSO₄·5H₂O in 100 mL of distilled water
0.1 mol/L NiCl₂·6H₂O—dissolve 2.38 g of NiCl₂ in 100 mL of distilled water
0.1 mol/L Pb(NO₃)₂—dissolve 3.31 g of Pb(NO₃)₂ in 100 mL of distilled water
100 mL solutions should be prepared in advance of the lab activity. Test tubes can be pre-labelled with the information, set 1, test tube 1, and so on.

Students are given an 8 to 10 mL sample of each solution (12 different test tubes) that are contained in a test tube rack.

A suggested teacher key is given for setting up each set of test tubes.

When Balancing a Redox Reaction:
- One substance is __oxidized____
- and it is also the __reducing____ agent.
- Its oxidation number __increases____.

When Balancing a Redox Reaction:
- One substance is __reduced____
- and it is also the __oxidizing____ agent.
- Its oxidation number __decreases____.
The rules for assigning oxidation numbers are identified below.

**Rule 1:** The oxidation number of any free atom (or multiple of itself) is 0.

*Examples:*
\[
C = 0 \quad H_2 = 0 \quad O_2 = 0
\]

**Rule 2:** An ion’s oxidation number is its charge when in ionic form.

*Examples:*
\[
Na^+ = +1 \quad P^{3+} = +3 \quad S^{2-} = -2
\]

**Rule 3:** In a compound or complex ion, the sum of all the oxidation numbers of each part must equal the total charge of that compound or complex ion.

*Examples:*
\[
\begin{align*}
NaCl & \quad CaCl_2 & \quad SO_4^{2-} \\
+1 - 1 & = 0 & +2 - 1 - 1 & = 0 & +6 - 2 - 2 - 2 - 2 & = -2
\end{align*}
\]

**Rule 4:** The oxidation number of hydrogen is +1, except in metal hydrides where H is the anion (e.g., CaH₂ or LiH) and the oxidation number is −1.

**Rule 5:** The oxidation number of oxygen is −2, except in peroxides (e.g., H₂O₂, Na₂O₂) where it is −1, and when in combination with fluorine (O = +2).

**Rule 6:** The oxidation number of a Group IA (Group 1) element in a compound is +1.

**Rule 7:** The oxidation number of a Group IIA (Group 2) element in a compound is +2.

**Rule 8:** In most cases, the oxidation number of a Group VIIA (Group 17) element in a compound is −1.

**Rule 9:** Within a compound containing complex ions, each element’s oxidation number can be determined using the charge on the complex ion.

*Example:*
- The compound Ni₂(SO₄)₃ contains the ions Ni³⁺ and SO₄²⁻.
- Since the oxidation number of O is −2 according to rule 5 (for a total of −8), S must be +6 to result in −2 charge on the sulphate ion.
- Therefore,

\[
\begin{align*}
Ni_2(SO_4)_3 & \quad results \ in \\
? & +6 -2 \\
Ni_2(SO_4)_3 & +3 +6 -2
\end{align*}
\]

\[
\begin{align*}
? & +18 -24 \\
Ni_2(SO_4)_3 & +6 +18 -24
\end{align*}
\]
Appendix 1.12A: Practical Applications of Redox Reactions
(Research Report and Presentation)

To learn more about the practical applications of redox reactions taking place around you, your group (of no more than three students) will research one of the following topics, write a report on your findings, and give an oral presentation.

Topics
1. rocket fuels
2. fireworks
3. household bleach (i.e., stain removal and chlorination)
4. photography
5. metal recovery from ores
6. steelmaking
7. aluminum recycling
8. fuel cells
9. batteries
10. tarnish removal
11. fruit clocks
12. forensic blood detection using luminol
13. chemiluminescence/bioluminescence
14. electrolytic cleaning
15. electrodeposition
16. photochemical etching
17. antioxidants/preservatives

Resources
You will need access to resources such as the following:
- school, university, or public libraries
- Internet
- textbooks (see teacher)
- email communication (e.g., with an expert)
- magazines, journals, and newspapers
- interviews
Appendix 1.12A: Practical Applications of Redox Reactions (Research Report and Presentation) (continued)

Project Requirements

Your research, report, and presentation should include the following:

- Identify the redox application you have selected.
- Describe the redox reaction taking place, including information on the substances being oxidized and reduced, as well as the oxidizing agents and the reducing agents.
- Address the effects of the process on the environment, and the energy consumption involved in the process.

Submit your group’s written project (of approximately two pages) to your teacher the day before your oral presentation. (Dates will be determined at the beginning of Topic 6: Electrochemistry, so that the written report can be copied for your classmates.)

The oral presentation should be approximately 10 minutes long and will be teacher-assessed. It will be followed by a brief question period (no longer than five minutes) in which the audience may ask clarifying questions.

Assessment

Please refer to the attached checklist and rubric for a more detailed list of the project requirements and assessment criteria for both the written report and the oral presentation.
Appendix 1.12B: Practical Applications of Redox Reactions (Sample Checklist and Assessment Rubric)

Checklist

Written Report
Have you included the following?

☐ Title page
☐ Bibliography with at least five sources
☐ The selected redox application
☐ All relevant redox reactions taking place
☐ All substances being oxidized and reduced, and any oxidizing agents and reducing agents
☐ The effects of the process on the environment
☐ The energy consumption involved in the process
☐ An introduction and a conclusion that connect the topic to redox chemistry
☐ Visual aids that help make the topic more easily understood
☐ Five possible test questions about the topic
☐ An answer key to the test questions

Oral Presentation
Have you included the following?

☐ Equal participation by all group members
☐ The selected redox application
☐ All relevant redox reactions taking place
☐ All substances being oxidized and reduced, and any oxidizing agents and reducing agents
☐ The effects of the process on the environment
☐ The energy consumption involved in the process
☐ An introduction and a conclusion that connect the topic to redox chemistry
☐ A logical flow and clear transitions
☐ Visual aids that help make the topic more easily understood

The information is

☐ Clear, accurate, concise
☐ Presented fully
☐ Interesting and easily understood
